HYDAC Diesel Fuel Filtration

YOUR UNTAPPED REVENUE STREAM

Are you tapping into every possible revenue source as an OEM? The answer to that question is the same as the answer to this one: Are you private-labeling diesel fuel filters for aftermarket business?

If you said no, you're not alone. Most OEMs view filters as commodities, especially aftermarket filter replacements, but they don't have to be if you're the one supplying that aftermarket business. By private-labeling or white-labeling filter replacements, you can capitalize on the aftermarket while providing end-users with more reliable, technologically advanced filtration. If you're not opening this stream of revenue, then you're leaving money on the table.

Make the most of the aftermarket diesel fuel filtration business by sourcing and private-labeling HYDAC diesel fuel filters with Evolution Motion Solutions. HYDAC diesel fuel filters boast more reliable filtration technology—with particulate filtration on the outside layer and water separation on the inside layer—and Evolution offers them at a very competitive price. We also provide white-labeling capabilities.

Dewatering and Diesel Bug

HYDAC's diesel fuel filtration technology provides all-around protection by combining high-efficiency particle separation with innovative multi-stage dewatering, meeting Tier 4/Stage 5 emission standards, reducing repair costs, and extending service intervals. The Optimicron Diesel elements for two-stage dewatering use materials specifically designed to coalesce and separate water from diesel, enabling secure and efficient dewatering even when the diesel's water content is low. By maintaining top-of-the-line diesel fuel filtration with dewatering, diesel bug cannot grow, extending diesel system efficiency and integrity.
